

CITY OF DUNCAN PUBLIC WORKS DEPARTMENT

The City of Duncan reminds you to be mindful of **STORMWATER MANAGEMENT** practices during this rainy season.

- Ensure sewer cleanout caps are in place
- Report out of place and/or missing sewer manhole lids

5-1202: DEFECTIVE AND PROHIBITED CONNECTIONS:

A. To minimize ground water infiltration and surface water inflow to the public wastewater system that overloads pipelines and inhibits wastewater treatment, the city hereby requires the owner of any property on which a defective sewer line or a prohibited connection is located to repair the service line or remove the prohibited connection at the owner's expense.

B. The city will investigate and determine if a service line is defective. Cracked, broken, crushed or similarly damaged lines, lines with separated joints, or lines with any condition that allows infiltration of ground water shall be considered defective.

C. The city will investigate and determine if a connection to the public sewer is a prohibited connection. Prohibited connections may be direct to the public sewer or indirect through the property service line. Roof drains, yard drains, driveway and parking area drains, foundation drains, exterior stairwell drains, uncapped cleanouts, sumps or any other system that conveys ground water or surface runoff to a public wastewater system may be considered a prohibited connection, even though such connection may not have been prohibited under existing ordinance, regulations or standards at the time of construction. (Ord. 1326, 3-24-1992)

YOUR ASSISTANCE IS GREATLY APPRECIATED
